## ［2］Design Calculations

## 1）Primary crusher

Capacity：$Q=\frac{5,670,000 \mathrm{t} / \mathrm{y}}{350 \mathrm{~d} / \mathrm{y} \times 24 \mathrm{~h} / \mathrm{d} \times 0.6}=1,125 \mathrm{t} / \mathrm{h}$
As a primary crusher，it is suitable to select jaw crusher or gyratory crusher．
In the case of the jaw crusher，however，its maximum capacity is limited to less to $1,000 \mathrm{mt} / \mathrm{h}$ ，so we rejected it from object of selection．Referring to catalogue of manufacturers，the gyratory crusher of 42－65－type was selected，taking account of maximum feed size and capacity．Number of 42 means that feed openingis 42 in i．e． $1,070 \mathrm{~mm}$ and 65 shows that maximum daiameter is $65 \mathrm{in}(1,650 \mathrm{~mm})$ ．
This value of capacity expresses tonnage of feed including fine ore，namely，there is no grizzly in upstream of the crusher．
$1,150 \mathrm{t} / \mathrm{h}$ of the capacity is estimated in the case of 38 mm of eccentric throw at $165 \mathrm{~mm}(0 . S . S .6 " 1 / 2$ ）of open side setting．
Particle size distribution of crushed products was estimated as follows．

| Particle sizes |  | Distributions | Cumulative Distr＇ns |
| :---: | :---: | :---: | :---: |
| $+6-1 / 2$ in | $(165 \mathrm{~mm})$ | $10.0 \%$ | $10.0 \%$ |
| 5 | $(125 \mathrm{~mm})$ | $15.0 \%$ | 25.0 |
| 4 | $(100 \mathrm{~mm})$ | 12.0 | 37.0 |
| 3 | $(75 \mathrm{~mm})$ | 15.0 | 52.0 |
| 2 | $(50 \mathrm{~mm})$ | 14.0 | 66.0 |
| 1 | $(25 \mathrm{~mm})$ | 14.0 | 80.0 |
| -1 |  | 20.0 | 100.0 |

Maximum product size will be estimated to be $165 \mathrm{~mm} \times 2.2=365 \mathrm{~mm}$ ．
Power requirement per ton of feed is calculated as the following．

$$
\mathrm{Kw} / \mathrm{mt}=\frac{\mathrm{Wi} \times 11.06 \times(\sqrt{\mathrm{F}}-\sqrt{\mathrm{P}})}{\sqrt{F} \times \sqrt{\mathrm{P}}}
$$

Hence，

$$
\begin{aligned}
\mathrm{Kw} / \mathrm{mt} & =\frac{10.8 \times 11.06(925356)}{925 \times 356} \\
& =0.206 \mathrm{kwh} / \mathrm{mt}
\end{aligned}
$$

Total power requirement can be obtained by the following equation．
$\mathrm{Kt}=$（Rating capacity of crusher $\mathrm{mt} / \mathrm{h}) \times \mathrm{Kw} / \mathrm{mt}$
$=1,125 \mathrm{mt} / \mathrm{h} \times 0.206 \mathrm{kwh} / \mathrm{mt}=231.8 \mathrm{kw}$
Recommended motor shuld be sized from 20\％to 25\％larger than the above－mentioned kw in order to overcome shock load．

Then， $231.8 \times 1.25=290 \mathrm{kw}$ ．．be rounded to 300 kw consequently．

## 2）Apron feeder

Required capacity：Min． $400 \mathrm{mt} / \mathrm{h}$ ，Max． $1,600 \mathrm{mt} / \mathrm{h}$
Apparent specific gravity of the crude ore：1．7 mt／m ${ }^{3}$
Volumes of the ore： $400 \mathrm{mt} / \mathrm{h} \div 1.7 \mathrm{mt} / \mathrm{m}^{3}=235 \mathrm{~m}^{3} / \mathrm{h}$ Min．
$1,600 \mathrm{mt} / \mathrm{h} \div 1.7 \mathrm{mt} / \mathrm{m}^{3}=941 \mathrm{~m}^{3} / \mathrm{h}$ Max.
$1,125 \mathrm{mt} / \mathrm{h} \div 1.7 \mathrm{mt} / \mathrm{m}^{3}=662 \mathrm{~m}^{3} / \mathrm{h}$ Averagingly

Sectional area of discharge opening： $1,800 \mathrm{mmW} \times 1,600 \mathrm{mmH}=2.88 \mathrm{~m}^{2}$
Voluminal efficiency： 0.9
Apron speed：V $235 \mathrm{~m}^{3} / \mathrm{h} \div\left(60 \mathrm{~min} / \mathrm{h} \times 2.88 \mathrm{~m}^{2} \times 0.9\right)=1.5 \mathrm{~m} / \mathrm{min} \operatorname{Min}$ ．
$941 \mathrm{~m}^{3} / \mathrm{h} \div\left(60 \mathrm{~min} / \mathrm{h} \times 2.88 \mathrm{~m}^{2} \times 0.9\right)=6.0 \mathrm{~m} / \mathrm{min}$ Max．
$662 \mathrm{~m}^{3} / \mathrm{h} \div\left(60 \mathrm{~min} / \mathrm{h} \times 2.88 \mathrm{~m}^{2} \times 0.9\right)=4.3 \mathrm{~m} / \mathrm{min} \mathrm{Av}$
Design allowable tension：T 30， 000 kg
Power requirement：$\quad K=\mathrm{VT} / 6,120=6 \mathrm{~m} / \mathrm{min} \times 30,000 \mathrm{~kg} / 6,120=29.4 \rightarrow 30 \mathrm{kw}$
Model selected：Kobe Steel Ltd．；Ultra－heavy duty type 18－66AFH
Generally speaking，capacity of the Apron fedder is influenced by type of feed． shape and size of particles，moisture，clay content and so on．To meet such factors successfully，it is advisable to adop variable speed motor．

Maximum feed lump size is estimated to be $165 \mathrm{~mm} \times 230 \mathrm{~mm} \times 330 \mathrm{~mm}$ approximately， based on the product size distribution of the primary crusher．

## 3）Primary screen

It is desirable to use double decked screes，using upper deck as gaurd screen for lower deck．Opening size of each deck aperture will be 70 mm for the upper deck and 28 mm for the lower deck，respectively．

Material balance is estimated as follows．
Upper screen undersize $=1,125 \mathrm{mt} / \mathrm{h} \times 45 \% \times 90 \%=456 \mathrm{mt} / \mathrm{h}$
（Assuming screening efficiency as $90 \%$ ．）
Lower screen undersize $=456 \mathrm{mt} / \mathrm{h} \times 20 / 45 \% \times 80 \%=162 \mathrm{mt} / \mathrm{h}$
In the case of lower deck，efficiencytends to be lower than upper deck，based on smaller feed size etc．

Total screen oversizes $=1,125 \mathrm{mt} / \mathrm{h}-162 \mathrm{mt} / \mathrm{h}=963 \mathrm{mt} / \mathrm{h}$
Required screen area is given by Gluck＇s equation．

$$
\mathrm{A}=\frac{\mathrm{Q}}{\mathrm{~B} \cdot \mathrm{ID} \cdot \mathrm{So} \cdot \mathrm{Sh} \cdot \mathrm{~F} \cdot \mathrm{O} \cdot \mathrm{~W} \cdot \mathrm{Y} \cdot \mathrm{M} \cdot \mathrm{Z}}
$$

Where

[^0]0 ：Open area facto；$=1-0,02(50-$ opening\％）
W ：Factor depending on bulk density＝1．7／1． $6=1.06$
$Y$ ：Shape factor due to shape of particles which varies by percentage of particles in total feed where major axis／minor axis ratio is bigger than 3 ，besides minor axis ranges from $1 / 2$ to $2 / 3$ ．
（ $5 \%$ ；1．00，10\％；0．95，20\％；0．85）
M：Wet screening factor
Dry；1．0，
Wet（In the case where water is sprayed $25 \sim 50$ l per $\mathrm{m}^{3} / \mathrm{h}$ of feed）

| Opening | 25.4 mm | 19.1 | 12.7 | 9.5 | 7.9 | 4.8 | 3.2 | 1.6 | 0.8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| $M$ | 2.9 | 2.71 | 2.5 | 2.25 | 2.1 | 1.9 | 1.75 | 1.5 | 1.25 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Z：Moisture and cohesion factor
Wet muddy or sticky gravel，gypsum，apatite etc．； 0.75
Ore with wet surfaces，Moisture $>6 \%$ and not water absorpivet materials ； 0.85

Dry limp materials，Moistur $<4 \% ; 1.0$
Assuming $I=0.95, F=1, W=1.06, Y=1, M=1, Z=0.75$ ，abovesaid equation can be expressed as the following．

$$
A=\frac{Q}{0.757 \times B \cdot I \cdot D \cdot S o \cdot S h \cdot 0 .}
$$

Then
$1,125 \times 1.102$
Upper deck $A=\frac{}{0.757 \times 9.0 \times 1 \times 1.19 \times 0.82 \times 1.28}=145 \mathrm{ft}^{2}$
$456 \times 1.102$
Lower deck $A=\frac{}{0.757 \times 5.9 \times 0.9 \times 1.5 \times 0.90 \times 1.16}=104 \mathrm{ft}^{2}$
$8^{\prime} \times 20^{\prime}$ Ripl－FloScreen（160 $\mathrm{ft}^{2}$ ）has capacity to meet the abovementioned requirement．

Check after Allis Chalmars＇s method．
$\mathrm{Ta}=\mathrm{Tb} \times \mathrm{V} \times \mathrm{H} \times \mathrm{K} \times \mathrm{W}$
where Ta：Actual capacity（st／ft² $/ \mathrm{h}$ ）
Tb ：Basic capacity（In the case of opening 2 ＂ $3 / 4 ; 8.8 \mathrm{st} / \mathrm{ft}^{2} / \mathrm{h}$ ）
V：Oversize factorof upper and lowr decks；1．42
H：Halfsize factor，upperdeck；0．8，lowerdeck； 0.70
K：Condition factor；dry uncrushed materials with $6 \%$ moisture 1.25
W：Weight factor；Bulk density $105 \mathrm{lb} / \mathrm{ft}^{3} \rightarrow 1.05$
Then，$\quad \mathrm{Ta}=8.8 \times 1.42 \times 0.8 \times 1.25 \times 1.05 \div 1.102=11.91 \mathrm{mt} / \mathrm{ft}^{2} \cdot \mathrm{~h}$
Hence required screen area $A$
$A=1,125 \mathrm{mt} / \mathrm{h} / 11.91 \mathrm{mt} / \mathrm{ft}^{2} \cdot \mathrm{~h}=94 \mathrm{ft}^{2}<160 \mathrm{ft}^{2}$
This will meet the above said requirement．

4）Flow sheet of the secondary crushing

7 ft Symons Standaerd type cone crushers were recommended as the secondary crushers． This model has $750 \mathrm{st} / \mathrm{h}$ ofcapacity in standard conditions．The bulk density in the standard conditions is 1.6 ．
Changing into metric tons，
Capacity $/$ Unit $=750 \mathrm{st} / \mathrm{h} \times 0.907 \mathrm{mt} / \mathrm{st} \times 1.7 / 1.6=722 \mathrm{mt} / \mathrm{h} \cdot \mathrm{Unit}$
Then，required unit number is obtained as the following．
Required units of 2 ry crushers $=963 \mathrm{mt} / \mathrm{h} \div 722 \mathrm{mt} / \mathrm{h}$－Unit

$$
=1.33 \rightarrow 2 \text { Units }
$$

After Taggart：Hand book of Mineral Dressing 4－54．，particle size distribution of the crushed product is estimated as the following．

| Particle sizedistribution of <br> Size <br> （mm） <br> +35 |  |  |  | Oversize\％ | crushed product <br> Cumulative oversize\％ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 25 | 28 | 28 |  |  |  |
| 17.5 | 16 | 44 |  |  |  |
| 12.5 | 15 | 59 |  |  |  |
| -12.5 | 12 | 71 |  |  |  |

The maximum size of the crushed product is estimated to be， $32 \mathrm{~mm} \times 2.2=70 \mathrm{~mm}$ from open side setting．

## Required power of the standard cone crushers

Required power per ton of ore

$$
\mathrm{Kw} / \mathrm{mt}=\frac{\mathrm{Wi} \times 11.06 \times(\sqrt{\mathrm{F}}-\sqrt{\mathrm{P}})}{\sqrt{\mathrm{F}} \times \sqrt{\mathrm{P}}}
$$

Where

> Wi: Work index $10.8 \mathrm{kwh} / \mathrm{st}$ $\mathrm{F}:$ Feed size $80 \%$ passing $\quad 140,000$ microns $\quad \sqrt{F}=374$ $\mathrm{P}:$ Product size $80 \%$ passing $40,000 \mathrm{microns} \quad \sqrt{P}=200$

Hence，

$$
\begin{aligned}
\mathrm{Kw} / \mathrm{mt} & =\frac{10.8 \times 11.06 \times(374-200)}{374 \times 200} \\
& =0.278 \mathrm{kwh} / \mathrm{mt}
\end{aligned}
$$

Total power requirement is obtained by multiplication of standard capacityto this．

$$
\mathrm{Kw}=0.278 \mathrm{kwh} / \mathrm{mt} \times 722 \mathrm{mt} / \mathrm{h}=200.7 \mathrm{kw} \text { 。 }
$$

Then recommended motor power perunit should be $200.7 \mathrm{kw} / 0.9=222 \mathrm{kw} \rightarrow 225 \mathrm{kw}$ ．

5）Material balance sheet of 2 ry screens and 3ry crushers

After Taggart Handbook 19－201，the following equations are given．
$K=\mathrm{Fb}_{\mathrm{b}} / \mathrm{C}=(\mathrm{c}-\mathrm{t}) /(\mathrm{fb}-\mathrm{t})$
$\mathrm{C}=\mathrm{Fa}$
$\mathrm{Fb}=\mathrm{Fa}(\mathrm{c}-\mathrm{t}) /(\mathrm{fb}-\mathrm{t})$
where $\quad \mathrm{Fa}_{\mathrm{a}}$ ：Tonnage of new feed＝Feed of 2ry crushers［mt／h］
Fb ：Total feed of 2ry screens［mt／h］
T ：Oversize of $2 r y$ screens［mt／h］
C ：Undersize of 2 ry screens［mt／h］
$\mathrm{F}_{\mathrm{c}}$ ：Tonnage of 3ry cusher product［mt／h］
$\mathrm{fa}_{\mathrm{a}}$ ：Percentage of smaller than a certain siz in new feed［\％］
fb ：Percentage of smaller than a certain size in total feed［\％］
t ：Percentage of smaller than a certain size in oversize［\％］
c ：Percentage of smaller than a certain size in undersize［\％］ Content of minus 18 mm size in each material is estimated after given catalogue and Taggart Handbook，as the following．

$$
\begin{aligned}
\mathrm{Fa} & =963 \mathrm{mt} / \mathrm{h}=\mathrm{C} \\
\mathrm{fb} & =53 \% \\
\mathrm{c} & =85 \% \\
\mathrm{t} & =11 \%
\end{aligned}
$$

Then

$$
K=\frac{c-t}{f b-t}=\frac{85-11}{53-11}=1.76
$$

$$
\mathrm{Fb}_{b}=\mathrm{Fa}_{\mathrm{a}} \times \mathrm{K}=963 \mathrm{mt} / \mathrm{h} \times 1.76=1,695 \mathrm{mt} / \mathrm{h}
$$

$$
\mathrm{T}=\mathrm{Fb}-\mathrm{C}=1,695 \mathrm{mt} / \mathrm{h}-963 \mathrm{mt} / \mathrm{h}=732 \mathrm{mt} / \mathrm{h}
$$

Hence the material balance is obtained as the follows．

## Material balance sheet of 2ry screens and 3ry crushers

Required area of the $2 r y$ screens is calculated by same mthod with $1 r y$ screens．

$$
A=\frac{1,695 \times 1,102}{0.757 \times 5.0 \times 1 \times 1.05 \times 0.95 \times 1.16}=426 \mathrm{ft}^{2}
$$

Hence unit number of the 2 ry screens of 8 ft by 20 ft will be estimated to be $N=426 \div(8 \times 20)=2.6 \rightarrow 3$ units

As 3ry crushers，7＇Symons short head cone crushers are recommended assuming closedset setting（C．S．S） 13 mm ．

Recommended capacity of the 7＇short head cone crushers is estimated after manufacturer＇s catalogue．

$$
Q=300 \mathrm{st} / \mathrm{h} \times 0.907 \mathrm{mt} / \mathrm{st} \times 1.7 / 1.6=289 \mathrm{mt} / \mathrm{h}
$$

Then unit number of the 3ry crushers will be

$$
N=732 \mathrm{mt} / \mathrm{h} \div 289 \mathrm{mt} / \mathrm{h} \cdot \frac{\text { 台 }=2.5 \rightarrow 3 \text { units. }}{}
$$

Required power per ton of ore

$$
\mathrm{Kw} / \mathrm{mt}=\frac{\mathrm{Wi} \times 11.06 \times(\sqrt{\mathrm{F}}-\sqrt{\mathrm{P}})}{\sqrt{\mathrm{F}} \times \sqrt{\mathrm{P}}}
$$

| Where | $W i:$ Work index $10.8 \mathrm{kwh} / \mathrm{st}$ |
| :--- | :--- |
|  | $\mathrm{F}:$ Feed size $80 \%$ passing 55,000 microns $\sqrt{ } \mathrm{F}=235$ |
| $\mathrm{P}:$ Product size $80 \%$ passing $26,000 \mathrm{microns} \quad \sqrt{ } \mathrm{P}=161$ |  |

Hence，

$$
\begin{aligned}
\mathrm{Kw} / \mathrm{mt} & =\frac{10.8 \times 11.06 \times(235-161)}{235 \times 161} \\
& =0.198 \mathrm{kwh} / \mathrm{mt}
\end{aligned}
$$

Total power requirement is obtained by multiplication of standard capacityto this．

$$
\mathrm{Kw}=0.198 \mathrm{kwh} / \mathrm{mt} \times 450 \mathrm{mt} / \mathrm{h} \times 1.25=112 \mathrm{kw} \text { 。 }
$$

This vakue is less than actual installed power of 225 kw and will meet the above said requirement．It is recommendable to install same motor with 2 ry crushers in order to minimize spare motors．

## 6）Vibrating feeders

Taking account of easy controllability，noise and costs，it is advantageous to select vibrating feeders，i．e．YASUKAWA Uras feeders．To drawoff the ore out of the coarse ore stock pile，running of 2 units of vibrating feeders will be expected normally．So averaging throughput per unit will be $1,125 \mathrm{mt} / \mathrm{h} / 2=563 \mathrm{mt} / \mathrm{h}$ ．Selection of the feeder，however，it is necessary to take account of temporary increased production．After catalogue data of the manufacturer，model of $1,400 \mathrm{mmW} \times 1,500 \mathrm{mmL}$ （capacity：1， $000 \mathrm{mt} / \mathrm{h} \cdot$ unit）will be suitable for this mission．

In order to increase live capacity of the coarse ore stock pil，we decided to install 4 units offeeders．（2 units operating， 2 units stand－by）．Theoritical throughput out of surge binwill be estimated as $1,695 \mathrm{mt} / \mathrm{h} / 3 \mathrm{units}=565 \mathrm{mt} / \mathrm{h} \cdot \mathrm{unit}$ ．It is also advisable to select the same model for this service with coarse ore stockpile drawoff，based on above－said reasons．

Installed motor will be $3.7 \mathrm{kw} \times 2 /$ unit after manufacturer＇s catalogue．
Each trough of the vibrating feeders should have 12 degrees of down slope for down stream．For these services，both 2 units of variable controllers will be installed to meet such conditions as valiation of moisture and clay content in the ore and ore sizes etc．Speed control will be able to realize by electrical remote controllers in central control room automatically or manually．

7）Coarse ore stock pile
The following assumptions were made．
Live inventory：Ore volume should should be for 6 hours of crushing operation．be
for 6 hours of crushing operation．
Total tonnage including dead should be for 24 hours of crushing operation．
Angle of repose： $40^{\circ}$
Angle of drawoff： $70^{\circ}$
Draw opening ： 4

Strictly speaking，calculations of movable inventory are very complicated， but in our case it is unnecessary to require such accuracy as small ore bin．

To simplify calculation of the movable tonnage，its volume was divided into three parts．
$\mathrm{V}_{1}$ ：Perfect conical part at top of the pile．
$V_{2}$ ：Circular truncated parts at intermediate of pile．
$\mathrm{V}_{3}$ ：Four inverted cones in the bottom

$$
\begin{aligned}
& V_{1}=\pi / 3 \cdot r^{2} h=3.14 \times 82 \times 6.4 \div 3=429 m^{3} \\
& V_{2}=1 / 3 \cdot h(B+b+B b)
\end{aligned}
$$

Where $\quad h$ ：Height $=7.5 \mathrm{~m}$
b：Bottome base area $=3.14 \times 52 \times 4=314 \mathrm{~m}^{2}$
B：Top base area $=420 \mathrm{~m}^{2}$ Obtained graphic calculation
Then $\mathrm{V}_{2}=1 / 3 \cdot 7.5 \times(314+420+314 \times 420)=2,742 \mathrm{~m}^{3}$
$V_{3}=\pi / 3 \cdot r^{2} h \times 4=3.14 \times 52 \times 11 \times 4 \div 3=1,151 \mathrm{~m}^{3}$

$$
V=V_{1}+V_{2}+V_{3}=429 m^{3}+2,742 m^{3}+1,151 \mathrm{~m}^{3}=4,322 m^{3}
$$

Hence，the movable tonnage of ore inventory $T$ should be

$$
\mathrm{T}=4,322 \mathrm{~m}^{3} \times 1.7 \mathrm{t} / \mathrm{m}^{3}=7,347 \mathrm{mt}
$$

In the case where lack of the movable inventory occurred by reasons of shortage of the run of mine，unscheduled shutdown of the primary crushing plant and so on， a part of dead stock shall be raked．A bulldozer of D6 class will be used for this purpose．

Roofing of the coarse ore stock pile shall not be installed．The reason is we expect that rain water will not flow into drawoff opening in the bottom and occur severe trouble，because ore sizes are coarse and very permeable．

No， 3 belt conveyor and floor of drawoff tunnel shall be sloped down with about $1 / 50$ of gentle slope．

In the case of extraordinal heavy rains，feeding to the No， 3 belt conveyor shall be stopped in order to prevent the ore in crater from sliding down．We expect that probability will be two or three times in every rainiy season．

## 8）Beltconveyors in the crushing plant

## 8－1．Design of belt conveyors

Because of ore charactristics，the maximum slope of belt conveyr will be limited to below $16^{\circ}$ on the primary crushing product and below $18^{\circ}$ on the 2 ry and 3ry cushing circuits respectively．

Taking into consideration that supply of special type belt will be defficult in local market we decided to use standard plain belts as a rule

## 8－2 Minimum belt widths

Minimum belt widths should be determined based on maximum size of lump ore．
Relationship between maximum lump ore size and belt widths in the following table．

Table 1．Relationship between maximum lump ore size and belt widths

| Min．belt widths $(\mathrm{mm})$ | 400 | 500 | 600 | 750 | 900 | 1,050 | 1,200 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Max．lump size $(\mathrm{mm})$ | 100 | 150 | 200 | 250 | 300 | 400 | 500 |

The width of No． 1 belt conveyor（ No ． 1 BC ）should be naturally wider than that of the Apron feeder in order to function as ore spill catcher．

Other conveyor widths were determined by tonnages of ore to be conveyed．
Standard belt speeds were selected based on the next table．
Table 2．Standard belt speeds for ore：v

| belt widths $(\mathrm{mm})$ | 400 | 600 | 900 | 1,500 | $\geqq 1,600$ |
| :--- | ---: | ---: | :---: | :---: | :---: |
| belt speeds $(\mathrm{m} / \mathrm{min})$ | 75 | 90 | 120 | 150 | 180 |

$8-3$ ．Transporting capacity of belt conveyors Qm

| $Q_{m}=Q_{t} / \gamma=60 \cdot \mathrm{k}_{1} \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v}$ |  |  |
| :---: | :---: | :---: |
| where $Q_{m}$ | Belt conveyor capacity | ［m $\left.{ }^{3} / \mathrm{h}\right]$ |
| Qt | Tonnage to be carried | ［mt／h］ |
| $\gamma$ | Bulk density | ［ $\mathrm{t} / \mathrm{m}^{3}$ |
| k1 | Factor based on conveyor |  |
| K2 | Factor based on trough | charge |
| v | ：belt speed | ［m／min］ |
| b | ：Belt width | ［m］ |

Table 3：．k1：Factor based on conveyor slope

| Slope angle（ ${ }^{\circ}$ ） | 2 | 4 | 6 | 8 | 10 | 12 | 14 | 16 | 18 | 20 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| K 1 | 1.00 | 0.09 | 0.98 | 0.97 | 0.95 | 0.93 | 0.91 | 0.89 | 0.85 | 0.81 |
| Slope angle（ ${ }^{\circ}$ ） | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 |

| $900 \sim$ | $30^{\circ}$ | $60^{\circ}$ |

8－3－1．Minimum belt speed of No． 1 BC

$$
\begin{aligned}
Q_{\mathrm{m}}= & Q_{\mathrm{t}} / \gamma=60 \cdot \mathrm{k}_{1} \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v} \\
\mathrm{Q}_{\mathrm{m}} & : 1,340 \mathrm{mt} / \mathrm{h} \text { max., } \gamma: 1.7, \mathrm{k}_{1}: 1.0, \mathrm{~K}_{2}: 0.1245, \mathrm{~b}: 1.80 \mathrm{~m} \\
\mathrm{v} & =1,340 \div\left\{60 \times 1.7 \times 1.0 \times 0.1245 \times(0.9 \times 1.8-0.05)^{2}\right\} \\
& =42.8 \mathrm{~m} / \mathrm{min}
\end{aligned}
$$

Taking account of future capacity expansion and compensation of shut down， belt speed of the No． 1 BCwas determined to be $70 \mathrm{~m} / \mathrm{min}$ ．

8－3－2．Minimum belt speed of No． 2 BC
$Q \mathrm{~m}=\mathrm{Qt} / \gamma=60 \cdot \mathrm{k} 1 \cdot \mathrm{~K} 2 \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v}$
Qm：1， $340 \mathrm{mt} / \mathrm{h}$ max．，$r: 1.7, \mathrm{k} 1: 0.91$ for $14^{\circ} 30^{\prime}, \mathrm{K} 2: 0.1488$ ，b：1．05m
$v=1,340 \div\left\{60 \times 1.7 \times 0.91 \times 0.1488 \times(0.9 \times 1.05-0.05)^{2}\right\}=121.1 \mathrm{~m} / \mathrm{min}$
Taking account of $10 \%$ of surplus，belt speed was determined to be $121.1 \mathrm{~m} / \mathrm{min} \times 1.1=133.2 \rightarrow 135 \mathrm{~m} / \mathrm{min}$ consequently．

8－3－3．Minimum belt speed of No． 3 BC
$Q \mathrm{~m}=\mathrm{Qt} / \gamma=60 \cdot \mathrm{k} 1 \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v}$
Qm： $1,500 \mathrm{mt} / \mathrm{h}$ max．，$r: 1.7, \mathrm{k} 1: 0.93$ for $12^{\circ}$ ，K2：0．1488， $\mathrm{b}: 1.05 \mathrm{~m}$
$v=1,500 \div\left\{60 \times 1.7 \times 0.93 \times 0.1488 \times(0.9 \times 1.05-0.05)^{2}\right\}$

$$
=132.7 \mathrm{~m} / \mathrm{min}
$$

Taking account of $15 \%$ of surplus，belt speed was determined to be $132.7 \mathrm{~m} / \mathrm{min} \times 1.15=152.6 \rightarrow 155 \mathrm{~m} / \mathrm{min}$ consequently．

## 8－3－4．Minimum belt speed of No． 4 \＆5BC

$$
\begin{aligned}
\mathrm{Qm} & =\mathrm{Qt} / \gamma=60 \cdot \mathrm{k}_{1} \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v} \\
\mathrm{Qm} & : 750 \mathrm{mt} / \mathrm{h} \max , \gamma: 1.7, \mathrm{k} 1: 0.93 \text { for } 13^{\circ} 16^{\prime} \mathrm{K} 2: 0.1488, \mathrm{~b}: 0.90 \mathrm{~m} \\
\mathrm{v} & =750 \div\left\{60 \times 1.7 \times 0.93 \times 0.1488 \times(0.9 \times 0.90-0.05)^{2}\right\} \\
= & 60.9 \mathrm{~m} / \mathrm{min}
\end{aligned}
$$

Taking account of $180 \%$ of surplus due to compensation for shutdown of one side system，belt speed was determined to be $60.9 \mathrm{~m} / \mathrm{min} \times 1.80=109.6 \rightarrow 110 \mathrm{~m} / \mathrm{min}$ consequently．

## 8－3－5．Minimum belt speed of No． 6 BC

$$
\begin{aligned}
& Q m=Q t / \gamma=60 \cdot \mathrm{k}_{1} \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v} \\
& \mathrm{Qm}: 1,870 \mathrm{mt} / \mathrm{h} \max ., \gamma: 1.7, \mathrm{k} 1: 0.95 \text { for } 10^{\circ}, \mathrm{K} 2: 0.1488, \mathrm{~b}: 1.20 \mathrm{~m} \\
& \mathrm{v}=1,870 \div\left\{60 \times 1.7 \times 0.95 \times 0.1488 \times(0.9 \times 1.20-0.05)^{2}\right\} \\
& =122.2 \mathrm{~m} / \mathrm{min}
\end{aligned}
$$

Taking account of $15 \%$ of surplus，belt speed was determined to be 122． $2 \mathrm{~m} / \mathrm{min} \times 1.15=140.5 \rightarrow 1501 \mathrm{~m} / \mathrm{min}$ consequently．

## 8－3－6．Minimum belt speed of No． 7 BC

$$
\begin{aligned}
\mathrm{Qm}= & Q \mathrm{t} / \gamma=60 \cdot \mathrm{k} 1 \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v} \\
\mathrm{Qm} & : 1,870 \mathrm{mt} / \mathrm{h} \text { max., } \gamma: 1.7, \mathrm{k} 1: 0.90 \text { for } 15^{\circ}, \mathrm{K} 2: 0.1488, \mathrm{~b}: 1.20 \mathrm{~m} \\
\mathrm{v}= & 1,870 \div\left\{60 \times 1.7 \times 0.90 \times 0.1488 \times(0.9 \times 1.20-0.05)^{2}\right\} \\
= & 129.0 \mathrm{~m} / \mathrm{min}
\end{aligned}
$$

Taking account of $15 \%$ of surplus，belt speed was determined to be $129.0 \mathrm{~m} / \mathrm{min} \times 1.15=148.4 \rightarrow 1501 \mathrm{~m} / \mathrm{min}$ consequently．

8－3－7．Minimum belt speed of No．8， 9 \＆10BC

$$
\begin{aligned}
& \mathrm{Qm}=\mathrm{Qt} / \gamma=60 \cdot \mathrm{k}_{1} \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v} \\
& \mathrm{Qm} \\
& \quad: 625 \mathrm{mt} / \mathrm{h} \max ., \gamma: 1.7, \mathrm{k} 1: 0.91 \text { for } 13^{\circ} 53^{\prime} \mathrm{K} 2: 0.1488, \quad \mathrm{~b}: 0.90 \mathrm{~m} \\
& \mathrm{v}
\end{aligned}=625 \div\left\{60 \times 1.7 \times 0.91 \times 0.1488 \times(0.9 \times 0.90-0.05)^{2}\right\},
$$

Taking account of $40 \%$ of surplus due to compensation for shutdown of one system，belt speed was determined to be $78.3 \mathrm{~m} / \mathrm{min} \times 1.40=109.6 \rightarrow 110 \mathrm{~m} / \mathrm{min}$ consequently．

8－3－8．Minimum belt speed of No． 11 BC

$$
\begin{aligned}
Q \mathrm{~m} & =Q \mathrm{t} / \gamma=60 \cdot \mathrm{k} 1 \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v} \\
\mathrm{Qm} & : 250 \mathrm{mt} / \mathrm{h} \text { max., } \gamma: 1.7, \mathrm{k} 1: 1.00 \text { for } 0^{\circ}, \mathrm{K} 2: 0.1488, \text { b: } 1.20 \mathrm{~m} \\
\mathrm{v} & =250 \div\left\{60 \times 1.7 \times 1.00 \times 0.1488 \times(0.9 \times 1.20-0.05)^{2}\right\} \\
& =15.5 \mathrm{~m} / \mathrm{min}
\end{aligned}
$$

Taking account of shock load when ore bridges slide down in the surge bin， belt speed was determined to be $135 \mathrm{~m} / \mathrm{min}$ consequently．

## 8－3－9 Minimum belt speed of No． 12 BC

$$
\begin{aligned}
& Q m= Q t / r=60 \cdot \mathrm{k}_{1} \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05)^{2} \cdot \mathrm{v} \\
& \mathrm{Qm} \\
& \mathrm{v}=: 1,500 \mathrm{mt} / \mathrm{h} \max , r: 1.7, \mathrm{k} 1: 0.97 \text { for } 6^{\circ} 57, \quad \mathrm{~K} 2: 0.1488, \mathrm{~b}: 1.20 \mathrm{~m} \\
&= 96.0 \mathrm{~m} / \mathrm{min}
\end{aligned}
$$

Taking account of $40 \%$ of surplus belt speed was determined to be 96 ． $0 \mathrm{~m} / \mathrm{min} \times 1.40=134.4 \rightarrow 1351 \mathrm{~m} / \mathrm{min}$ consequently．

8－3－10 Minimum belt speed of No． 13 BC

$$
Q m=Q t / \gamma=60 \cdot \mathrm{k}_{1} \cdot \mathrm{~K}_{2} \cdot(0.9 b-0.05)^{2} \cdot \mathrm{v}
$$

$$
\text { Qm } \quad: 1,500 \mathrm{mt} / \mathrm{h} \max ., \gamma: 1.7, \mathrm{k} 1: 0.90 \text { for } 14^{\circ} 39^{\prime}, \mathrm{K} 2: 0.1488, \mathrm{~b}: 1.05 \mathrm{~m}
$$

$$
v=1,500 \div\left\{60 \times 1.7 \times 0.90 \times 0.1488 \times(0.9 \times 1.05-0.05)^{2}\right\}
$$

$$
=137.0 \mathrm{~m} / \mathrm{min}
$$

Taking account of $10 \%$ of surplus belt speed was determined to be $137.0 \mathrm{~m} / \mathrm{min} \times 1.10=150.7 \rightarrow 1551 \mathrm{~m} / \mathrm{min}$ consequently．

8－3－11 Minimum belt speed of No． 14 \＆15BC

$$
\begin{aligned}
Q m= & Q t / \gamma=60 \cdot \mathrm{k}_{1} \cdot \mathrm{~K}_{2} \cdot(0.9 \mathrm{~b}-0.05) 2 \cdot \mathrm{v} \\
\mathrm{Qm} & : 1,500 \mathrm{mt} / \mathrm{h} \max , r: 1.7, \mathrm{k} 1: 0.88 \text { for } 16^{\circ} 20^{\prime} \mathrm{K} 2: 0.1488, \mathrm{~b}: 1.20 \mathrm{~m} \\
\mathrm{v} & =1,500 \div\left\{60 \times 1.7 \times 0.88 \times 0.1488 \times(0.9 \times 1.20-0.05)^{2}\right\} \\
& =105.9 \mathrm{~m} / \mathrm{min}
\end{aligned}
$$

Taking account of $20 \%$ of surplus belt speed was determined to be $105.9 \mathrm{~m} / \mathrm{min} \times 1.20=127.1 \rightarrow 135 \mathrm{~m} / \mathrm{min}$ consequently．

## 8－4．所要動力の計算

Required power $P: \quad P=P_{1}+P_{2} \pm P_{3}+P_{t} \quad[k w]$
Conveyor power without load $\mathrm{P}_{1}: \mathrm{P}_{1}=0.06 \mathrm{fWv}(\mathrm{I}+10) / 367 \quad$［kw］
Power by horizontal load $P_{2}$ ：$P_{2}=f \cdot Q t(I+10) / 367 b \quad[k w]$
Power by vertical load $\mathrm{P}_{3}$ ： $\mathrm{P}_{3}= \pm \mathrm{h} \cdot \mathrm{Qt} / 367$ downward－［kw］
Power by tripper $\mathrm{Pt}_{\mathrm{t}}$［kw］
where I ：horizontal length of conveyor（distance between axis and axis of pulleys）
Io ：calibrated horizontal conveyor length cf．Table 6 ［m］
h ：lift
Qt ：tonnage to be carried
［m］
［mt／h］

| $v$ | $:$ belt speed | $[\mathrm{m} / \mathrm{min}]$ |
| :--- | :--- | :--- |
| $W$ | $:$ weight of revolving parts without load | $[\mathrm{kg} / \mathrm{m}]$ |
| $W_{1}$ | $:$ weight of belt | $[\mathrm{kg} / \mathrm{m}]$ |
| $\mu$ | $:$ friction coefficient between belt and pulley |  |
| $\theta$ | $:$ wrap angle of belt | $[\mathrm{rad}]$ |
| $I_{c}:$ carrier roller spacing | $[\mathrm{m}]$ |  |
| $I_{r}$ | $:$ return roller spacing | $[\mathrm{m}]$ |
| $f$ | $:$ revolutionary friction coefficient of roller |  |

Table 6．Revolutionary friction coefficient of roller f \＆calibrated horizontal conveyor length lo

| Structure of roller | f | 10 |
| :---: | :---: | :---: |
| Common roller | 0.03 | 49 |
| Special low resistant，precision finished roller | 0.022 | 66 |
| Down sloped conveyor | 0.012 | 156 |

Table． 7 Belt width，belt weight $W$ ，weight of revolving parts W1 \＆tripper power Pt

| Belt width |  | W | W1 | $\begin{aligned} & \hline \mathrm{Pt} \\ & \mathrm{kw} \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: |
| mm | in | kg／m | kg／m |  |
| 400 | 16 | 22.4 | 4.5 |  |
| 450 | 18 | 28 | 7.0 | 1.5 |
| 500 | 20 | 30 | 7.5 |  |
| 600 | 24 | 35.5 | 9.0 |  |
| 750 | 30 | 53 | 13.0 |  |
| 900 | 36 | 63 | 15.5 | 2． 65 |
| 1，050 | 42 | 80 | 23.0 |  |
| 1，200 | 48 | 90 | 26.0 | 3． 55 |
| 1，400 | 56 | 112 | 33.0 |  |
| 1，600 | 64 | 125 | 38.0 | 5.0 |
| 1，800 | 72 | 150 | 46.0 |  |
| 2，000 | 80 | 160 | 51.0 | 6.0 |

Table 8．Friction coefficient between belt and pulley $\mu$

| pulley | Operating conditions | $\mu$ |
| :---: | :---: | :---: |
| Naked steel | Wet by muddy water | 0.1 |
|  | Moistened | $0.1 \sim 0.2$ |
|  | dry | 0.25 |
| Corrugated rubber | Wet by muddy water | 0.2 |
| lagging | Moistened | $0.2 \sim 0.3$ |
|  | dry | 0.35 |

a）Calculations of belt tensions

| Effective tension： | $\mathrm{Fp}_{\mathrm{p}}=6,120 \mathrm{P} / \mathrm{v}$ | ［kg］ |
| :---: | :---: | :---: |
| Tension on slack side | $F_{2}=F p / e^{\mu \theta-1}$ | ［kg］ |
| Slope tension： | $\mathrm{F}_{3}=\mathrm{W} 1(\mathrm{~h} \pm \mathrm{f} \cdot \mathrm{I})$ down slope + | ［kg］ |
| Minimum tension | Adopt bigger value from the following |  |
| Carrier side；F4 | $=50 / 8 \cdot \mathrm{Ic}$（Qt $/ 0.06 \mathrm{v}+\mathrm{W}_{1}$ ） |  |
| Return side；F4 | $=50 / 8 \cdot \mathrm{lr} \cdot \mathrm{W}_{1}$ |  |

b）Maximum tension：Adopt the maximum value in the following．

$$
\begin{array}{llll}
F_{\max }=F_{p}+F_{2} & \text { or } & F_{p}+F_{4} \quad(\text { hor izontal }) \\
F_{\max }=F_{p}+F_{2} & \text { or } & F_{p}+F_{3}+F_{4} & \text { (sloped) }
\end{array}
$$

c）Safety factor $S$ ：
Canvas belt $\quad S=\sigma_{c} \times b \times n / F_{\text {max }}$
Steel code belt $S=\sigma_{s} \times n / F_{\text {max }}$ Where $\quad \sigma_{c}:$ strength per one ply $\quad[\mathrm{kg} / \mathrm{cm} \cdot \mathrm{ply}]$
$\sigma_{s}$ ：strength per one code［kg／cord］

## 8－4－1．Required power of No． 1 BC

In this case，$B=1,800 \mathrm{~mm}, Q_{t}=1,340 \mathrm{mt} / \mathrm{h}, \mathrm{h}=0 \mathrm{~m}, \mathrm{I}=11.7 \mathrm{~m}, \mathrm{v}=70 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3.49 \mathrm{rad}, \mu=0.3, \mathrm{~W}=150 \mathrm{~kg} / \mathrm{m}, \mathrm{f}=0.03$

Then $\quad P_{1}=0.06 \times 0.03 \times 150 \times 70 \times(11.7+49) / 367=3.13 \mathrm{kw}$ $\mathrm{P}_{2}=0.03 \times 1,340 \times(11.7+49) / 367=6.65 \mathrm{kw}$ $P_{3}=+(0 \times 1,340) / 367=0$ $\mathrm{Pt}=0$
Hence $\quad P=3.13+6.65=9.78 \mathrm{kw}$
Recommended motor power Pm is $9.78 / 0.8=12.23 \rightarrow 15 \mathrm{kw}$ ．

## 8－4－2．Required power of No． 2 BC

In this case，$B=1,050 \mathrm{~mm}, Q_{t}=1,340 \mathrm{mt} / \mathrm{h}, \mathrm{h}=51.5 \mathrm{~m}, \mathrm{I}=197.5 \mathrm{~m}, \mathrm{v}=135 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3.49 \mathrm{rad}, \quad \mu=0.3, W=150 \mathrm{~kg} / \mathrm{m}, \quad \mathrm{f}=0.03$
Then $\quad P_{1}=0.06 \times 0.03 \times 80 \times 135 \times(197.5+49) / 367=13.06 \mathrm{kw}$
$P_{2}=0.03 \times 1,340 \times(197.5+49) / 367=27.00 \mathrm{kw}$ $P_{3}=+(51.5 \times 1,340) / 367=188.04 \mathrm{kw}$ $\mathrm{Pt}_{\mathrm{t}}=0$
Hence $\quad P=13.06+27.00+188.04=228.1 \mathrm{kw}$
Recommended motor power Pm is $228.1 / 0.8=285.12 \rightarrow 150 \mathrm{kw} \times 2=300 \mathrm{kw}$

## 8－4－3．Required power of No． 3 BC

In this case，$B=1,050 \mathrm{~mm}$ ，$Q_{t}=1,500 \mathrm{mt} / \mathrm{h}, \mathrm{h}=5.5 \mathrm{~m}, \mathrm{I}=68.5 \mathrm{~m}, \mathrm{v}=155 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3.49 \mathrm{rad}, \quad \mu=0.3, W=150 \mathrm{~kg} / \mathrm{m}, \quad \mathrm{f}=0.03$
Then $\quad P_{1}=0.06 \times 0.03 \times 80 \times 155 \times(68.5+49) / 367=7.15 \mathrm{kw}$ $\mathrm{P}_{2}=0.03 \times 1,500 \times(68.5+49) / 367=14.41 \mathrm{kw}$ $\mathrm{P}_{3}=+(5.5 \times 1,500) / 367=22.48 \mathrm{kw}$ $\mathrm{Pt}_{\mathrm{t}}=0$
Hence $\quad P=7.15+14.41+22.48=44.04 \mathrm{kw}$
Recommended motor power Pm is $44.04 / 0.8=55.05 \rightarrow 55 \mathrm{kw}$

## 8－4－4．Required power of No． 4 \＆5BC

In this case，$B=900 \mathrm{~mm}$ ， $\mathrm{Qt}_{\mathrm{t}}=750 \mathrm{mt} / \mathrm{h}, \mathrm{h}=10.8 \mathrm{~m}, \mathrm{I}=45.8 \mathrm{~m}, \mathrm{v}=110 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3.49 \mathrm{rad}, \mu=0.3, \mathrm{~W}=150 \mathrm{~kg} / \mathrm{m}, \mathrm{f}=0.03$
Then $\quad P_{1}=0.06 \times 0.03 \times 65 \times 110 \times(45.8+49) / 367=3.32 \mathrm{kw}$
$\mathrm{P}_{2}=0.03 \times 750 \times(45.8+49) / 367=5.81 \mathrm{kw}$
$\mathrm{P}_{3}=+(10.8 \times 750) / 367=22.07 \mathrm{kw}$

$$
P \mathrm{t}=0
$$

Hence $\quad P=3.32+5.81+22.07=31.2 \mathrm{kw}$
Recommended motor power Pm is $31.2 / 0.8=39 \rightarrow 45 \mathrm{kw}$

## 8－4－5．Required power of No． 6 BC

In this case，$B=1,200 \mathrm{~mm}$ ，$Q_{t}=1,870 \mathrm{mt} / \mathrm{h}, \mathrm{h}=3.2 \mathrm{~m}, \mathrm{I}=69.2 \mathrm{~m}, \mathrm{v}=150 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3.49 \mathrm{rad}, \mu=0.3, W=150 \mathrm{~kg} / \mathrm{m}, \quad \mathrm{f}=0.03$

Then $\quad P_{1}=0.06 \times 0.03 \times 90 \times 150 \times(69.2+49) / 367=7.83 \mathrm{kw}$ $P_{2}=0.03 \times 1,870 \times(69.2+49) / 367=18.07 \mathrm{kw}$ $P_{3}=+(3.2 \times 1,870) / 367=16.31 \mathrm{kw}$ Pt $=0$
Hence $\quad P=7.83+18.07+16.31=42.21 \mathrm{kw}$
Recommended motor power Pm is $42.21 / 0.8=52.76 \rightarrow 55 \mathrm{kw}$

## 8－4－6．Required power of No． 7 BC

In this case，$B=1,200 \mathrm{~mm}$ ，$Q t=1,870 \mathrm{mt} / \mathrm{h}, \mathrm{h}=19.4 \mathrm{~m}, \mathrm{I}=68.31 \mathrm{~m}, \mathrm{v}=150 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3.49 \mathrm{rad}, \mu=0.3, \mathrm{~W}=150 \mathrm{~kg} / \mathrm{m}, \mathrm{f}=0.03$

Then $\quad P_{1}=0.06 \times 0.03 \times 90 \times 150 \times(68.31+49) / 367=7.77 \mathrm{kw}$
$P_{2}=0.03 \times 1,870 \times(68.31+49) / 367=17.93 \mathrm{kw}$ $P_{3}=+(19.4 \times 1,870) / 367=98.85 \mathrm{kw}$ $\mathrm{Pt}=0$
Hence $\quad P=7.77+17.73+98.85=124.55$
Recommended motor power Pm is 125．55／0．8＝155． $69 \rightarrow 150 \mathrm{kw}$

## 8－4－7．Required power of No．8，9 \＆ 10 BC

In this case，$B=900 \mathrm{~mm}$ ， $\mathrm{Qt}=625 \mathrm{mt} / \mathrm{h}, \mathrm{h}=10.4 \mathrm{~m}, \mathrm{I}=44.68 \mathrm{~m}, \mathrm{v}=105 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3$ ．49rad，$\mu=0.3, \mathrm{~W}=150 \mathrm{~kg} / \mathrm{m}, \mathrm{f}=0.03$

Then $\quad P_{1}=0.06 \times 0.03 \times 65 \times 105 \times(44.68+49) / 367=3.14 \mathrm{kw}$
$P_{2}=0.03 \times 625 \times(44.68+49) / 367=4.79 \mathrm{kw}$
$P_{3}=+(10.4 \times 625) / 367=17.71 \mathrm{kw}$ Pt $=0$
Hence $\quad P=3.14+4.79+17.71=25.64 \mathrm{kw}$
Recommended motor power $\mathrm{Pm}_{\mathrm{m}}$ is 25．64／0．8＝32．05 $\rightarrow 37 \mathrm{kw}$

8－4－8．Required power of No． 11 BC
In this case，$B=1,200 \mathrm{~mm}, Q \mathrm{t}=1,500 \mathrm{mt} / \mathrm{h}, \mathrm{h}=0.0 \mathrm{~m}, \mathrm{I}=14.0 \mathrm{~m}, \mathrm{v}=135 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3$ ．49rad，$\mu=0.3, W=150 \mathrm{~kg} / \mathrm{m}, \mathrm{f}=0.03$

Then $\quad P_{1}=0.06 \times 0.03 \times 90 \times 135 \times(14.0+49) / 367=3.75 \mathrm{kw}$ $P_{2}=0.03 \times 1,500 \times(14.0+49) / 367=7.72 \mathrm{kw}$ $P_{3}=+(0.0 \times 1,500) / 367=0.00 \mathrm{kw}$ $\mathrm{Pt}_{\mathrm{t}}=0$
Hence $\quad P=3.75+7.72=11.47 \mathrm{kw}$
Recommended motor power Pm is $11.47 / 0.8=14.34 \rightarrow 15 \mathrm{kw}$

8－4－9．Required power of No． 12 BC
In this case，$B=1,200 \mathrm{~mm}, Q_{t}=1,500 \mathrm{mt} / \mathrm{h}, \mathrm{h}=4.6 \mathrm{~m}, \mathrm{I}=46.7 \mathrm{~m}, \mathrm{v}=135 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3.49 \mathrm{rad}, \mu=0.3, W=150 \mathrm{~kg} / \mathrm{m}, \mathrm{f}=0.03$
Then $\quad P_{1}=0.06 \times 0.03 \times 90 \times 135 \times(46.7+49) / 367=5.70 \mathrm{kw}$ $P_{2}=0.03 \times 1,500 \times(46.7+49) / 367=11.73 \mathrm{kw}$ $\mathrm{P}_{3}=+(4.6 \times 1,500) / 367=18.80 \mathrm{kw}$ $\mathrm{Pt}=0$
Hence $\quad P=3.70+11.73+18.80=36.23 \mathrm{kw}$
Recommended motor power Pm is $36.23 / 0.8=45.28 \rightarrow 45 \mathrm{kw}$

## 8－4－9．Required power of №． 13 BC

In this case，$B=1,050 \mathrm{~mm}$ ，$Q_{t}=1,500 \mathrm{mt} / \mathrm{h}, \mathrm{h}=20.1 \mathrm{~m}, \mathrm{I}=77.1 \mathrm{~m}, \mathrm{v}=155 \mathrm{~m} / \mathrm{min}$ ，rubber lagged

$$
\text { pulley, } \theta: 200^{\circ}=3.49 \mathrm{rad}, \mu=0.3, \mathrm{~W}=150 \mathrm{~kg} / \mathrm{m}, \mathrm{f}=0.03
$$

Then $\quad P_{1}=0.06 \times 0.03 \times 80 \times 155 \times(77.1+49) / 367=6.67 \mathrm{kw}$
$\mathrm{P}_{2}=0.03 \times 1,500 \times(77.1+49) / 367=15.46 \mathrm{kw}$
$P_{3}=+(20.1 \times 1,500) / 367=82.15 \mathrm{kw}$
$\mathrm{Pt}=0$
Hence $\quad P=6.67+15.46+82.15=104.28 \mathrm{kw}$
Recommended motor power $\mathrm{Pm}_{\mathrm{m}}$ is $104.28 / 0.8=130.35 \rightarrow 150 \mathrm{kw}$
8－4－10．Required power of No． 14 \＆ 15
In this case，$B=1,200 \mathrm{~mm}, Q_{t}=1,500 \mathrm{mt} / \mathrm{h}, \mathrm{h}=4.5 \mathrm{~m}, \mathrm{I}=15.5 \mathrm{~m}, \mathrm{v}=135 \mathrm{~m} / \mathrm{min}$ ，rubber lagged pulley，$\theta: 200^{\circ}=3.49 \mathrm{rad}, \mu=0.3, \mathrm{~W}=150 \mathrm{~kg} / \mathrm{m}, \mathrm{f}=0.03$
Then $\quad P_{1}=0.06 \times 0.03 \times 90 \times 135 \times(15.5+49) / 367=3.84 \mathrm{kw}$
$\mathrm{P}_{2}=0.03 \times 1,500 \times(15.5+49) / 367=7.91 \mathrm{kw}$
$\mathrm{P}_{3}=+(4.5 \times 1,500) / 367=18.39 \mathrm{kw}$
$\mathrm{Pt}=0$
Hence $\quad P=3.84+7.91+18.39=30.14 \mathrm{kw}$
Recommended motor power Pm is $30.14 / 0.8=37.68 \rightarrow 37 \mathrm{kw}$
Table 9．Driving coefficient $1 / \mathrm{e}^{\mu \theta-1}$

|  | $\mu$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\theta$ | 0.35 | 0.30 | 0.25 | 0.20 |
| $180^{\circ}$ | 0.499 | 0.638 | 0.838 | 1.140 |
| 200 | 0.418 | 0.541 | 0.718 | 0.990 |
| 210 | 0.384 | 0.499 | 0.667 | 0.925 |

## 8－8．Conveyor belt selection

In order to hold capabilities of anti abrasion and anti shock against rugged lump ores，it is necessary to have a certain rubber thickness to each ore size．

## 8－8－1．Maximum ore sizes for each conveyor

Maximum ore sizes for each conveyorare shown in Table． 10.
Table10．Maximum ore sizes for each conveyor

| Maximum ore size | ConveyorNo． |
| :--- | :--- |
| $350 \mathrm{~mm}\left(14^{\prime \prime}\right)$ | No， $1,2,3,4,5 \mathrm{BC}$ |
| $70 \mathrm{~mm}\left(2^{\prime \prime} 1 / 2\right)$ | No $, 6,7,8,9,10 \mathrm{BC}$ |
| $25 \mathrm{~mm}\left(1^{\prime \prime}\right)$ | No， $11,12,13,14,15, \mathrm{BC}$ |

8－8－2．Specifications of conveyor belts（BANDO CHEMICAL INDUSTRIES，LTD．）
Referring to above mentioned data and manufacturer＇s catalogueswe selected conveyor belts as the following．
［Steel code ST－1250］：No．2BC
Belt width： $1,250 \mathrm{~mm}$ ，top cover ： 8 mm ，：bottom cover 6 mm
Tensile strength：more than $1,250 \mathrm{~kg} / \mathrm{cm}$
Code diameter： $4.6 \mathrm{~mm} \phi$ ，code structure： $7 \times 7$ ，code pitch ： 14.5 mm ，
Code number：70，galvanization for element：zinc
［Banlon\＃900］：No． 1 BC
Belt width： $1,800 \mathrm{~mm}$ ，top cover： 15 mm ，bottom cover： 6 mm Cushion rubber：anti－abrasion \＆anti－shock load，
Tensile strength：more than： $900 \mathrm{~kg} / \mathrm{cm}$
Elongation of cover rubber：new priduct 450\％，after aging 400\％
［Banlon \＃800］：No，3，4，5，7，14， 15 BC
Belt width： $1,200 \mathrm{~mm}, 1,050 \mathrm{~mm}, \quad 900 \mathrm{~mm}, 3$ plies
top cover ： 6 mm ，bottom cover ： 2 mm ，
Tensile strength：more than $800 \mathrm{~kg} / \mathrm{cm}$
Elongation of cover rubber：new priduct 450\％，after aging $380 \%$
［Banlon \＃500］：No，6，11，12， 13 BC
Belt width： $1,200 \mathrm{~mm}, 750 \mathrm{~mm}, 3$ or 2 plies
top cover ： 6 mm or 4 mm ，bottom cover ： 2 mm ，
Tensile strength：more than $500 \mathrm{~kg} / \mathrm{cm}$
Elongation of cover rubber：new priduct：450\％，after aging 380\％
［Banlon\＃400］：No，8，9， 10 BC
Belt width： $900 \mathrm{~mm}, \quad 2 \mathrm{plies}$
top cover ： 6 mm ，bottom cover： 2 mm ，
Tensile strength：more than： $400 \mathrm{~kg} / \mathrm{cm}$
Elongation of cover rubber：new priduct：450\％，after aging 380\％

8－9．Specifications of rubber lagging for head pulleys
Type：Model 5，special double helical
Pulley width：belt width +150 mm

8－10．Specifications of rollers
Standard carrier ：

Self－aligning carrier：
Standard idler：
Self－aligning idler：
［Sanki］BKM $20^{\circ} 3$ roller type
BKM $30^{\circ} 3$ roller type
$2^{\circ}$ inclind forward 3 roller type flat 1 roller type
$2^{\circ}$ inclind forward 2 roller type

Self－aligning
idler roller／KAR

idler roller／KR

Rubber sleeved

> idler roller/KSR
Spiral
idler roller

Guide roller
for carrier

for flat belt

## 8－11．Accessories

Belt cleaner：scraper with carbide tips for outside head pulley type V－type scraper for belt inside
Emergency switch：pull switch for conveyor side
Snaking detector：tumbler switch type
Choking detector ：hanging switch type

Belt cleaner
scraper with carbide tips for outside head pulley type

Emergency switch
tumbler switch type

Choking detector
hanging switch type

9）Fine ore stock pile
9－1．Design concept
Structure of fine ore stock pile was designed to get necessary inventory capacity and minimize construction costs．The stock pile will consist of two cones which a part of them penetrate each other．We estimated dimensiones of each cone to be $55.6 \mathrm{~m} \phi \times 24 \mathrm{mH}$ with angle of repose $40^{\circ}$ ．

Conceptional figure of the fine ore stock pile
9－2．Calculation of total volume including dead stock $V$

$$
V=\left(V_{1}-V_{2}\right) \times 2
$$

Where volume of a perfect cone： $\mathrm{V}_{1}$

$$
V_{1}=\pi / 3 \cdot R 2 H=3.14 \times 27.82 \times 24 / 3=19,413 \mathrm{~m}^{3}
$$

Volume of penetrated part ：V2
Area of bow：S

$$
\begin{aligned}
& \begin{array}{l}
S=1 / 2 \cdot R 2(C-\sin C) \\
\text { Where unit of central angle } C \text { is radian. } \\
=1 / 2 \cdot 27.82 \quad(1.918-0.940)=378 \mathrm{~m}^{2} \\
\text { Then } \quad V 2=378 \mathrm{~m}^{2} \times 6.7 / 3=844 \mathrm{~m}^{3} \\
\quad V=(19,413-844) \times 2=37,138 \mathrm{~m}^{3}
\end{array}
\end{aligned}
$$

Hence maximum total tonnage T

$$
\mathrm{T}=37,138 \mathrm{~m}^{3} \times 1.7 \mathrm{mt} / \mathrm{m}^{3}=63,135 \mathrm{mt} .
$$

## 9－3．Calculations of live inventory Va

To simplifycaluculation，the live inventory was devided into volume of two perfect cones $\mathrm{V}^{\prime} 1$ and eight inverted cones $\mathrm{V}^{\prime} 2$ ．
$\mathrm{V}^{\prime} 1=\pi / 3 \cdot \mathrm{r}^{2}{ }^{2} \mathrm{~h} 1 \times 2=3.14 \times 122 \times 9 \times 2 / 3=2,713 \mathrm{~m}^{3}$
$\mathrm{V}^{\prime} 2=\pi / 3 \cdot \mathrm{r}^{2}{ }^{2} \mathrm{~h}_{2} \times 8=3.14 \times 62 \times 15 \times 8 / 3=4,521 \mathrm{~m}^{3}$
Hence volume of the live inventory is givenby the following equation．
$V^{\prime} \quad=V^{\prime}{ }_{1}+V^{\prime}{ }_{2}=2,713 \mathrm{~m}^{3}+4,521 \mathrm{~m}^{3}=7,234 \mathrm{~m}^{3}$
Then tonnage of the live inventory will be $7,234 \mathrm{~m}^{3} \times 1.7 \mathrm{mt} / \mathrm{m}^{3}=12,298 \mathrm{mt}$ ．

It was decided that central parts of the each con of the fine ore stock pile will be covered by octagonal pyramid shaped roofs in order to prevent from sliding due to the heavy rains．

End
